

Computer Science 202

Data-Warehousing

Objectives

- The difference between operational data and decision support
- What a data warehouse is and how its data are prepared
- What star schemas are and how they are constructed
- What steps are required to implement a data warehouse successfully
- What data mining is and what role it plays in decision support

Why Data Analysis?

- External and internal forces require tactical and strategic decisions
- Search for competitive advantage
- Business environments are dynamic
- Decision-making cycle time is reduced
- Different managers require different decision support systems (DSS)

COMPANY	PROBLEM	BENEFIT
Moon, Inc. Manufacturers of bathroom and kitchen fixtures and supplies. Source: Cognos Corp. www.cognos.com	<ul style="list-style-type: none">• Information generation very limited and time-consuming• Only five people knew how to extract data using a 3GL• Response time unacceptable for Managers' decision-making purposes	<ul style="list-style-type: none">• Provided quick answers to ad hoc questions for decision making• Provided access to data for decision-making purposes• Got in-depth view of product performance and customer margins
Pacific Gas Transmission Co. Natural gas provider in Pacific Northwest Source: Oracle Corp. www.oracle.com	<ul style="list-style-type: none">• Rapid changes in markets due to deregulation• Diminishing profits in traditional services	<ul style="list-style-type: none">• Managers able to analyze data quickly• Positioned company to quickly identify market trends• Created new services and pricing structures
Sega Corporation Interactive entertainment systems and video games Source: Oracle Corp. www.oracle.com	<ul style="list-style-type: none">• Needed way to rapidly analyze great amount of data• Needed to track advertising coupons, and rebates associated with effects of pricing changes• Used to do it with Excel spreadsheets, leading to human errors	<ul style="list-style-type: none">• Eliminated data-entry errors• Identified successful marketing strategies to dominate interactive entertainment niches• Used product analysis to identify better markets/product offerings

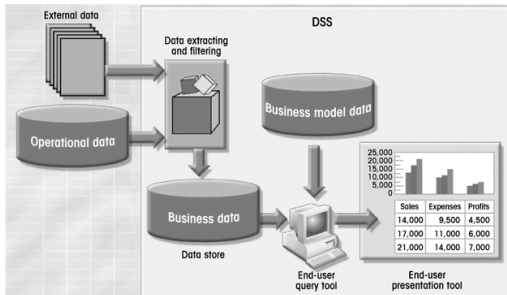

Decision Support Systems

- Decision Support
 - Is a methodology
 - Extracts information by processing data
 - Uses information as basis for decision making
- Decision support system (DSS)
 - Arrangement of computerised tools
 - Used to assist managerial decision
 - Extensive data "massaging" to produce information
 - Used at all levels in organization
 - 'Drill Down' functionality
 - Interactive
 - Provides *ad hoc* query tools

DSS components

- Data Store
 - The large component that holds the organisational data
- Data Extraction and Filtering
 - Retrieval of information from the store and filtering it based on user supplied criteria
- Query Tool
 - Allows the users to generate Ad-hoc queries
- Presentation Tool
 - Used to organise and present the data in a suitable format

DSS Components

8

Operational Data vs DS Data

- Operational data
 - Relational, normalized database
 - Optimized to support transactions
 - Real time updates
- DSS
 - Snapshot of operational data
 - Summarized
 - Large amounts of data
- Data analyst viewpoint
 - Timespan
 - Granularity
 - Dimensionality

Barry Irwin August 2003

Rhodes University CS202 Databases

10

The DSS Database

- Database schema
 - Support complex (non-normalized) data
 - Extract multidimensional time slices
- Data extraction and filtering
- End-user analytical interface
- Database size
 - Very large databases (VLDBs)
 - Contains redundant and duplicated data

Barry Irwin August 2003

Rhodes University CS202 Databases

11

The Data Warehouse

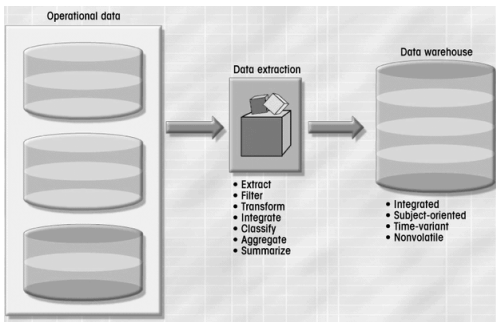

- Integrated
 - Centralized
 - Holds data retrieved from entire organization
- Subject-Oriented
 - Optimized to give answers to diverse questions
 - Used by all functional areas
- Time Variant
 - Flow of data through time
 - Projected data
- Non-Volatile
 - Data never removed
 - Always growing

Barry Irwin August 2003

Rhodes University CS202 Databases

13

Data Marts

- Single-subject data warehouse subset
- Decision support to small group
- Can be test for exploring potential benefits of Data warehouses
- Address local or departmental problems
- Similar to a warehouse but smaller in scale

Barry Irwin August 2003

Rhodes University CS202 Databases

14

DSS Architectures

- Traditional mainframe-based OLTP
- Managerial information system (MIS) with 3GL
- First-generation departmental DSS
- First-generation enterprise data warehouse using RDMS
- Second-generation data warehouse using MDBMS
- See Table 13.7 page 627 for details

Barry Irwin August 2003

Rhodes University CS202 Databases

15

Twelve Data warehouse Rules

- Separated from operational environment
- Data are integrated
- Contains historical data over long time horizon
- Snapshot data captured at given time
- Subject-oriented data
- Mainly read-only data with periodic batch updates from operational source, no online updates
- Development life cycle differs from classical one, data driven not process driven

Barry Irwin August 2003

Rhodes University CS202 Databases

16

Twelve Data warehouse Rules

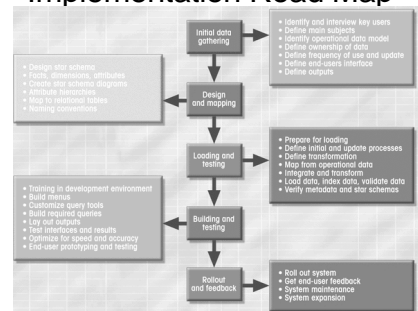

- Contains different levels of data detail
 - Current and old detail
 - Lightly and highly summarized
- Characterized by read-only transactions to large data sets
- Environment has system to trace data resources, transformation, and storage
- Metadata critical components
 - Identify and define data elements
 - Provide the source, transformation, integration, storage, usage, relationships, and history of data elements
- Contains charge-back mechanism for usage
 - Enforces optimal use of data

Barry Irwin August 2003

Rhodes University CS202 Databases

17

Data Warehouse Implementation Road Map

Barry Irwin August 2003

Rhodes University CS202 Databases

18

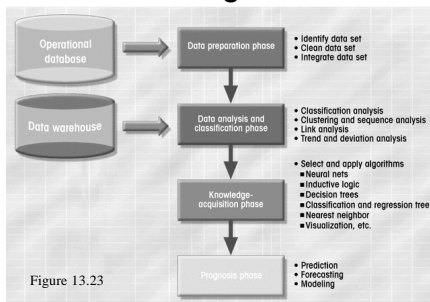

Data Mining

- Seeks to discover unknown data characteristics
- Automatically searches data for anomalies and relationships
- Data mining tools
 - Analyze data
 - Uncover problems or opportunities
 - Form computer models based on findings
 - Predict business behavior with models
 - Require minimal end-user intervention

Extraction of Knowledge from Data

Data Mining Process

Star Schemas

- Used for mapping of Multi-Dimensional Data into a relational Database
